TITLE

ARYLAMINO FUSED PYRIDINES AND PYRIMIDINES

5

FIELD OF THE INVENTION

This invention relates to novel compounds and pharmaceutical compositions, and to methods of using same in the treatment of psychiatric disorders and neurological diseases including major depression, anxiety-related disorders, post-traumatic stress disorder, supranuclear palsy and feeding disorders.

BACKGROUND OF THE INVENTION

15 Corticotropin releasing factor (herein referred to as CRF), a 41 amino acid peptide, is the primary physiological regulator of proopiomelanocortin(POMC)-derived peptide secretion from the anterior pituitary gland [J. Rivier et al., *Proc. Nat. Acad. Sci. (USA)* 80:4851 (1983); W. Vale et al., *Science* 213:1394 (1981)]. In addition to its endocrine role at the pituitary gland, immunohistochemical localization of CRF has demonstrated that the hormone has a broad extrahypothalamic distribution in the central nervous system and produces a wide spectrum of autonomic, electrophysiological and behavioral effects consistent with a neurotransmitter or neuromodulator role in brain [W. Vale et al., *Rec. Prog. Horm. Res.* 39:245 (1983); G.F. Koob, *Persp. Behav. Med.* 2:39 (1985); E.B. De Souza et al., *J. Neurosci.* 5:3189 (1985)]. There is also evidence that CRF plays a significant role in integrating the response of the immune system to physiological, psychological, and immunological stressors [J.E. Blalock, *Physiological Reviews* 69:1 (1989); J.E. Morley, *Life Sci.* 41:527 (1987)].

Clinical data provide evidence that CRF has a role in psychiatric disorders and neurological diseases including depression, anxiety-related disorders and feeding disorders. A role for CRF has also been postulated in the etiology and pathophysiology of Alzheimer's disease, Parkinson's disease, Huntington's disease, progressive supranuclear palsy and amyotrophic lateral sclerosis as they relate to the dysfunction of CRF neurons in the central nervous system [for review see E.B. De Souza, *Hosp. Practice* 23:59 (1988)].

In affective disorder, or major depression, the concentration of CRF is significantly increased in the cerebral spinal fluid (CSF) of drug-free individuals [C.B. Nemeroff et al., *Science* 226:1342 (1984); C.M. Banki et al., *Am. J. Psychiatry* 144:873 (1987); R.D. France et al., *Biol. Psychiatry* 28:86 (1988); M. Arato et al., *Biol Psychiatry* 25:355 (1989)]. Furthermore, the density of CRF receptors is significantly decreased in the frontal cortex of suicide victims, consistent with a hypersecretion of CRF [C.B. Nemeroff et al., *Arch. Gen. Psychiatry* 45:577 (1988)]. In addition, there is a blunted adrenocorticotropin (ACTH) response to CRF (i.v. administered) observed in depressed patients [P.W. Gold et al., *Am J. Psychiatry* 141:619 (1984); F. Holsboer et al., *Psychoneuroendocrinology* 9:147 (1984); P.W. Gold et al., *New Eng. J. Med.* 314:1129 (1986)]. Preclinical studies in rats and non-human primates provide additional support for the hypothesis that hypersecretion of CRF may be involved in the symptoms seen in human depression [R.M. Sapolsky, *Arch. Gen. Psychiatry* 46:1047 (1989)]. There is preliminary evidence that tricyclic antidepressants can alter CRF levels and thus modulate the numbers of CRF receptors in brain

[Grigoriadis et al., *Neuropsychopharmacology* 2:53 (1989)].

There has also been a role postulated for CRF in the etiology of anxiety-related disorders. CRF produces anxiogenic effects in animals and interactions between benzodiazepine / non-benzodiazepine anxiolytics and CRF have been demonstrated in a variety of behavioral anxiety models [D.R. Britton et al., *Life Sci.* 31:363 (1982); C.W. Berridge and A.J. Dunn *Regul. Peptides* 16:83 (1986)]. Preliminary studies using the putative CRF receptor antagonist α -helical ovine CRF (9-41) in a variety of behavioral paradigms demonstrate that the antagonist produces "anxiolytic-like" effects that are qualitatively similar to the benzodiazepines [C.W. Berridge and A.J. Dunn *Horm. Behav.* 21:393 (1987), *Brain Research Reviews* 15:71 (1990)]. Neurochemical, endocrine and receptor binding studies have all demonstrated interactions between CRF and benzodiazepine anxiolytics providing further evidence for the involvement of CRF in these disorders. Chlordiazepoxide attenuates the "anxiogenic" effects of CRF in both the conflict test [K.T. Britton et al., *Psychopharmacology* 86:170 (1985); K.T. Britton et al., *Psychopharmacology* 94:306 (1988)] and in the acoustic startle test [N.R. Swerdlow et al., *Psychopharmacology* 88:147 (1986)] in rats. The benzodiazepine receptor antagonist (Ro15-1788), which was without behavioral activity alone in the operant conflict test, reversed the effects of CRF in a dose-dependent manner while the benzodiazepine inverse agonist (FG7142) enhanced the actions of CRF [K.T. Britton et al., *Psychopharmacology* 94:306 (1988)].

The mechanisms and sites of action through which the standard anxiolytics and antidepressants produce their therapeutic effects remain to be elucidated. It has been hypothesized however, that they are

involved in the suppression of the CRF hypersecretion that is observed in these disorders. Of particular interest is that preliminary studies examining the effects of a CRF receptor antagonist (α -helical CRF9-41) in a variety of behavioral paradigms have demonstrated that the CRF antagonist produces "anxiolytic-like" effects qualitatively similar to the benzodiazepines [for review see G.F. Koob and K.T. Britton, In: *Corticotropin-Releasing Factor: Basic and Clinical Studies of a Neuropeptide*, E.B. De Souza and C.B. Nemeroff eds., CRC Press p221 (1990)].

10 The term "peptide bond" means a covalent amide linkage formed by loss of a molecule of water between the carboxyl group of one amino acid and the amino group of a second amino acid.

The term "pharmaceutically acceptable salts"
15 includes acid or base salts of the compounds of formulas (I) and (II). Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid salts of basic residues such as amines; alkali or organic salts of acidic residues

Pharmaceutically acceptable salts of the compounds of the invention can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the
25 appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred. Lists of suitable salts are found in Remington's

Synthesis

20

The bicyclic fused pyrimidine and pyridines of this invention can be prepared by one of the general schemes outlined below (Scheme 1-9).

Compounds of the Formula (I) wherein $X=Y=N$ and
25 $Z=NR^3$, can be prepared as shown in Scheme 1.

Scheme 1

- The 4,6-dihoxypyrimidines (III) can be nitrated using fuming nitric acid and then converted into intermediates (IV) by the action of phosphorous oxychloride with the optional assistance of a catalyst such as dialkylanilines (see: Brown, D.J. et.al. J. Chem. Soc., 1954, 3832). The amino group of pyrimidines of Formula (V) can be prepared from the corresponding nitro compounds (IV) by treatment with reducing agents such as, but not limited to, sodium dithionate, iron or zinc, or catalytic hydrogenation

(see: Larock, R.C. *Comprehensive Organic Transformations*, VCH Publishers, New York, 1989, 411). Reaction with Ar-NH₂ can be used to provide compounds of Formula (VI). Conditions which may

5 facilitate this transformation include the optional presence of protic or aprotic acids, or bases such as alkali metal hydrides, trialkylamines, or alkali metal carbonates, or alkali metal bis(trimethylsilyl)amides wherein the metal can be sodium, lithium, or

10 potassium. These reactions may be conducted neat, or in the optional presence of solvents such as but not limited to cyclic ethers such as tetrahydrofuran, dialkylformamides, ethylene glycol, 2-ethoxyethanol, halocarbons, alkanenitriles, or alkyl alcohols at room

15 temperature or at elevated temperature up to the boiling point of the solvent employed. One skilled in the art of organic synthesis will readily understand the optimal combinations of these conversions to prepare a number of compounds of Formula (VI).

20 Cyclization to triazolopyrimidines of Formula (VII) can then be readily accomplished by diazotization and cyclization of the diamino compounds of Formula (VI) with an alkali metal nitrite in the presence of acid in water with or without an organic cosolvent such as

25 halocarbons, or cyclic ethers. Treatment of compound of Formula (VII) with primary amines then can provide the intermediates (VIII) using reaction conditions similar to those employed for the conversion of (V) to (VI). The rearranged triazolopyrimidine of Formula

30 (IX) may be obtained from the triazolopyrimidine of Formula (VIII) by treatment with base such as but not limited to, alkali metal hydrides, alkaline earth metal hydrides, alkali metal dialkyl amides in inert solvents such as dialkylformamides, dialkylacetamides

35 at temperatures ranging from 0 ° to 200 °C. Finally, reaction with an appropriate R⁴L wherein L is a suitable leaving group such as halo, methanesulfonate,

p-toluenesulfonate, or triflate in the presence or absence of bases such as but not limited to, alkali metal hydrides, alkaline earth metal hydrides, alkali metal dialkyl amides in inert solvents such as dialkylformamides or dialkylacetamides at temperatures ranging from 0 ° to 200 °C can be used to generate compounds of Formula (I).

Alternatively, compounds of Formula (I) wherein $X=Y=N$ and $Z=NR^3$, of this invention can be prepared as outlined in Scheme 2:

Scheme 2

Treatment of compound of Formula (V) with primary amines can provide the diamino substituted pyrimidines

(X). Conditions which facilitate this transformation are detailed previously for the conversion of (VII) to (VIII). Cyclization to triazolopyrimidines of Formula (XI) can then be readily accomplished by following the conditions already described for the conversion of (VI) to (VII) in Scheme 1. The leaving group such as, but not limited to, halogen can then be displaced by addition of Ar-NH₂ to provide compounds of Formula (IX) by utilizing the conditions described for the conversion of (V) to (VI). Compounds of Formula (IX) can be converted to (I) in the same way as outlined in Scheme 1.

Compounds of the Formula (VI) can also prepared by an another approach (Scheme 3) involving addition of Ar-NH₂ to (IV) to afford compounds of Formula (XII).

Scheme 3

The nitro group in (XII) can be reduced to give compounds of Formula (VI) under conditions similar to those described for the transformation of (IV) to (V) in Scheme 1. Alternatively, as shown in Scheme 3, addition of Ar-NH₂ to compounds of Formula (IV) can

generate in-situ the pyrimidones (XIII). For example, treatment of dichloropyrimidines of Formula (IV) with one equivalent of Ar-NH₂ in the presence of solvents such as (but not limited to) dialkylsulfoxides, dialkylformamides, and alkyl alcohols readily generate pyrimidones (XIII). Compounds of Formula (XIII) can be converted into (IV) by the action of phosphorous oxychloride with the optional assistance of a catalyst such as dialkylanilines with or without an inert solvent. Compounds of Formula (VI) are elaborated to structures of Formula (I) as previously shown in Scheme 1.

Scheme 4 outlines another route to fused triazolopyrimidine type of compounds of this invention.

Scheme 4

4,6-dihydroxy-5-nitropyrimidines can be treated with
 aryl sulfonic anhydrides, aryl sulfonyl chlorides,
 5 alkyl sulfonic anhydrides or alkyl sulfonyl chlorides
 in the presence or absence of bases such as alkali
 metal hydrides, alkaline earth metal hydrides, alkali
 metal dialkyl amides in inert solvents such as
 dialkylformamides, dialkylacetamides at temperatures
 10 ranging from 0 ° to 200 °C to give intermediates of
 Formula (XIV). Compounds of Formula (XIV) are treated
 with primary amines to give aminonitropyrimidines
 (XV). Treatment of (XV) with Ar-NH₂ can provide
 compounds of Formula (XVI). Compounds of the formula
 15 (XVI) can be reduced to amino derivatives (XVII) using

the reagents described for the conversion of (IV) to (V) in Scheme 1.. Intermediate (XVII) can be converted to a mixture of (VIII) and (IX) by diazotization and cyclization. Compounds of the

5 Formula (VIII) can be converted to (IX) by treatment with base such as but not limited to, alkali metal hydrides, alkaline earth metal hydrides, alkali metal dialkyl amides in an inert solvent. Compounds of

10 Formula (IX) are elaborated to give (I) as delineated in Scheme 1.

Fused imidazolopyrimidines of the Formula (I) wherein $X=N$, $Y=CR^2$, and $Z=NR^3$, can be prepared from compound (X) as shown in Scheme 5.

15

Scheme 5

Treatment of (X) with an acylating agent such as, but not limited to, alkyl anhydrides, haloalkyl anhydrides, alkylamides, haloalkyl amides, trialkylorthoesters $R^2(OR)_3$ (where R is C₁-C₄ alkyl),
 5 guanidines, cyanogen bromide, R^2COOH , urea or thiourea in the presence or absence of an acid (such as HOAc, HCl, H₂SO₄) in the presence or absence of an organic cosolvent such as alkyl alcohols, cyclic ethers, or aromatic solvents at temperatures ranging from 0 ° to
 10 200 °C. Treatment of (XVIII) with Ar-NH₂ can provide compounds of Formula (XIX). Finally, alkylation of compound (XIX) can provide imidazolopyrimidine (I, wherein X=N, Y=CR², Z=NR³).

The 1,2,3-thiadiazolo[5,4-d]pyrimidines of the
 15 formula (I) (wherein X=Y=N and Z=S), can be prepared as shown in Scheme 6.

Scheme 6

20

Compounds of the formula (VII) with thiourea can react upon heating in presence of solvents such as but not limited to, cyclic ethers such as tetrahydrofuran,

dialkylformamides such as dimethylformamide, dialkyl acetamides, ethylene glycol, 2-ethoxyethanol, halocarbons such as methylene chloride, alkanenitriles such as acetonitrile, or alkyl alcohols such as methanol, ethanol to give compound (XX) which is alkylated to afford thiadiazolpyrimidine (I) (wherein $X=Y=N$ and $Z=S$). Compounds of Formula (I) can be converted to sulfoxides as well sulfones under a variety of oxidizing agents such as but not limited to $NaIO_4$, $KMnO_4$ or m-chloroperbenzoic acid.

The method of synthesis of the triazolopyridines of this invention is shown in Scheme 7.

Scheme 7

- The hydroxy groups in (XXI) can be converted into chloro groups by the action of phosphorous oxychloride with the optional assistance of a catalyst such as dialkylaniline (see: Brown, D.J. et.al. J. Chem. Soc., 1954, 3832) to afford compounds of Formula (XXII). Addition of primary amines to compound (XXII) can provide alkylaminonitropyridines (XXIII). The nitro group in (XXIII) can be reduced using the conditions employed for the transformation of (IV) to

(V) to give (XXIV). Diazotization and cyclization of (XXIV) can provide chlorotriazolopyridine derivatives (XXV) as was described for the conversion of (VI) to (VII) in Scheme 1. The chloro group can then be
5 displaced by addition of Ar-NH₂ to afford compounds (XXVI) and then treated with R⁴L to give (I).

Imidazolopyridines of the present invention can be prepared from compound (XXIV) as shown in Scheme 7
10 by following the conditions outlined for the conversion of (X) to (XVIII) in Scheme 5. Treatment of compound (XXVII) with Ar-NH₂ using the conditions outlined in Scheme 1 can provide compounds of Formula (I, where R⁴=H). Alkylation with R⁴L can afford
15 imidazolopyridines of formula I (where R⁴ is not equal to H).

Alternatively, the triazolopyridines can be synthesized as shown in Scheme 8.

Scheme 8

- 5 Treatment of compounds of Formula (XXI) with an aliphatic or aromatic amine in the appropriate organic solvent but not limited to, alkyl alcohols such as methanol, ethanol, propanol, butanol, alkyl alkanooates such as ethyl acetate, alkanenitriles such as acetonitrile, dialkyl formamides such as DMF gives the corresponding ammonium salt, which upon treatment with $POCl_3$ at temperatures from 25 to 120 °C, give compounds of Formula (XXVIII). This was converted to (XXIII) by

treatment with POCl_3 at temperatures from 25 to 120 °C. Compounds of Formula (XXIII) could be coupled with Ar-NH_2 with or without the presence of solvent at temperatures from 25 to 200 °C to give product (XXX).

- 5 These could be converted to intermediates (XXXI) by reduction of the nitro group under a variety of reducing conditions, such as those used for the conversion of (IV) to (V) in Scheme 1. The final cyclization was carried out as described for the
- 10 conversion of (VI) to (VII) in Scheme 1.

Compounds of general formula (II) may be prepared according to the procedures outlined in Scheme 9.

Scheme 9

Intermediates of formula (X), (XV) or (XXIV) may be converted to compounds of formula (XXXIII) by
 5 treatment with an acylating agent in the presence or absence of a base in an inert solvent at reaction temperatures ranging from $-78^{\circ}C$ to $200^{\circ}C$. Acylating agents include, but are not limited to, phosgene, thiophosgene, diphosgene, triphosgene, carbonyl
 10 diimidazole, thiocarbonyl diimidazole,

dialkylcarbonates (such as diethyl carbonate) or $R^aR^bN(C=G)OR^c$ (where $G = O, S$; R^a , R^b , and R^c are independently C1-C8 alkyl). Bases include, but are not limited to, alkali metal alkoxides, alkali metal hydrides, trialkyl amines, pyridine, 4-dimethylaminopyridine, alkali metal dialkyl amides or alkali metal bis(trimethylsilyl)amides. Inert solvents include, but are not limited to, halocarbons, alkanenitriles, dialkylformamides, dialkylacetamides, dialkyl ethers, cyclic ethers such as tetrahydrofuran or dioxane, or alkyl alcohols. Intermediates of (XXXIII) may be converted to compounds of formula (XXXIV) (Formula (II) where $R^4 = H$) by reaction with $ArNH_2$, using the conditions described for the conversion of compound (V) to (VI) in Scheme 1.

Compounds of Formula (XXXV) may be prepared from compounds of structure (XXXIII) by reaction with $R^{13}L$ (where L is a leaving group such as halide, alkanesulfonate or arylsulfonate) in the presence or absence of a base in an inert solvent. Bases and inert solvents may be the same as those listed above for the preparation of (XXXIII). Intermediates of Formula (XXXV) can be reacted with $ArNH_2$ to give compounds of formula (XXXVI) (Formula (II), where $R^4 = H$) using the conditions described for the conversion of compound (V) to (VI) in Scheme 1. Compounds of Formula (XXXVI) may be converted to compounds of (XXXVII) (Formula (II), where R^4 does not equal H) by treatment with R^4L (where L is a leaving group such as halide, alkanesulfonate or arylsulfonate) in the presence or absence of a base in an inert solvent. Bases and inert solvents may be the same as those listed above for the preparation of (XXXIII).

As illustrated in Scheme 10, treatment of compounds of Formula (XXI) with an aliphatic or

aromatic amine in an appropriate organic solvent (such as but not limited to, alkyl alcohols such as methanol, ethanol, propanol, butanol, alkyl alkanoates such as ethyl acetate, alkanenitriles such as acetonitrile, dialkyl formamides such as DMF) gives the corresponding ammonium salt, which upon treatment with POCl₃ at temperatures from 25 to 120 °C, give compounds of Formula (XXVIII). Treatment of compounds of Formula (XXVIII) with appropriate primary amines R³NH₂ in an organic solvent (such as but not limited to, alkyl alcohols such as methanol, ethanol, propanol, butanol, alkyl alkanoates such as ethyl acetate, alkanenitriles such as acetonitrile, dialkyl formamides such as DMF, dialkylsulfoxides) at temperatures from 25 to 120 °C provides compounds of Formula (XXIX). These can be converted to (XXIII) by treatment with POCl₃ at temperatures from 25 to 120 °C. Compounds of Formula (XXIII) can be converted to intermediates (XXIV) by reduction of the nitro group under a variety of reducing conditions, such as those used for the conversion of (IV) to (V) in Scheme 1. Diazotization and cyclization of (XXIV) can provide chlorotriazolopyridine (XXV) as was described for the conversion of (VI) to (VII) in Scheme I. The chloro group can then be displaced by addition of Ar-NH₂ in the presence of an acid such as but not limited to HCl, H₂SO₄, AcOH, methanesulfonic acid, p-toluenesulfonic acid in inert solvents such as toluene, xylenes at temperatures ranging from 0 ° to 200 °C to afford product I. Scheme 10

As shown in Scheme 11, reaction of a 4-amino-3-nitro-pyridone of formula (XXIX) with a reducing agent, such as Na₂S₂O₄ affords the corresponding 4-amino-3-amino-pyridone of formula (XXXVII). This transformation can be effected under a variety of reducing conditions, such as catalytic hydrogenation, reducing metal reaction (Fe, Sn, Zn), hydride reaction (NaBH₄, LiAlH₄) etc., which are known to those skilled in the art. The 4-amino-3-amino-pyridone can be converted to the

triazolopyridone of formula (XXXVIII) by treatment with an alkali metal nitrite, such as NaNO_2 , under acidic conditions. The resulting triazolopyridone can be converted to the corresponding halo-triazolopyridine of formula (XXXIX) ($\text{X} = \text{Cl}, \text{Br}$), by treatment with a halogenating agent such as POCl_3 , PBr_3 , POBr_3 . Alternatively X can be an appropriate leaving group resulting from treatment of the triazolopyridone with triflic, tosic or mesyl anhydride in the presence of a base. The triazolopyridine can be coupled with arylamines ArNH_2 under acidic, basic or thermal catalysis to compounds of Formula I.

Scheme 11

Example 1

N-[2-bromo-4-(1-methylethyl)phenyl]-5-methyl-3-propyl-3H-1,2,3-triazolo[4,5-d]pyrimidin-7-amine

- Part A:** 4,6-Dihydroxy-2-methylpyrimidine (60 g) was added in portions to fuming nitric acid (120 mL) at 0 °C while cooling the reaction flask. After completion of addition, the reaction was stirred an additional 1 h at 0 °C followed by another 1 h at room temperature. The reaction mixture was then poured over ice (200 g) and the ice was allowed to melt. A light pink solid was isolated by filtration and washed with cold water (100 mL). The solid was dried in a vacuum oven overnight to yield 4,6-dihydroxy-2-methyl-5-nitropyrimidine (72.5 g).
- Part B:** The product of Part A was added portionwise to phosphorous oxychloride (400 mL) under a nitrogen atmosphere followed by dropwise addition of N,N-diethylaniline (80 mL). The reaction mixture was refluxed for 2 1/2 h with stirring, cooled to room temperature, poured over ice (2.0 Kg) and stirred for 1 hr. The aqueous layer was extracted with diethyl ether (4 x 500 mL) and the extracts combined. The combined extracts were washed with brine (500 mL), dried over anhydrous magnesium sulfate, filtered and stripped down to afford 4,6-dichloro-2-methyl-5-nitropyrimidine as a yellow solid (68.8 g) which has an unpleasant odor.

Part C: The product of Part B (42 g) was added to acetic acid (77 mL) and methanol (350 mL). To this mixture was added iron powder (42 g) in portions, stirred for 2 h at 60-65 °C, cooled to room

temperature, and filtered. The filtrate was stripped to a brown solid, which was extracted with ethyl acetate (2 x 500 mL), washed with 1N NaOH (250 mL), and brine (500 mL). The organic layer was dried over anhydrous magnesium sulfate, filtered and stripped down to yield 5-amino-4,6-dichloro-2-methylpyrimidine as a pale yellow solid (25.4 g).

The reaction mixture was cooled, removed the solvent, extracted the residue with dichloromethane, washed with water, dried over anhydrous magnesium sulfate. Filtered the extract, removed the solvent and residue was purified by flash column chromatography on a silica gel using methanol + CH₂Cl₂ (1:100) to yield 5-amino-4-(2-bromo-4-isopropylphenyl)-amino-6-chloro-2-methylpyrimidine as a cream colored solid (16.05 g).

To this stirred mixture was added sodium nitrite (2.55 g) in water (10 mL) dropwise at room temperature. After completion of addition, the reaction was stirred for an additional 15 mins. The organic layer was separated, washed with water, dried with anhydrous magnesium sulfate, and stripped down to a residue. The residue was purified by flash column chromatography (CH₂Cl₂) to afford light brown oil. The oil was crystallized from 1:1 hexane + pentane (15 mL) to yield 3-[2-bromo-4-(1-methylethyl)phenyl]-7-chloro-5-methyl-3H-1,2,3-triazolo[4,5-d]pyrimidine as an off-white solid (12.15 g).

Part F: The product of Part E (0.65 g) was dissolved in dichloromethane (20 mL) and then added 1.0 g of 1-propylamine at room temperature. The reaction mixture was stirred at room temperature for 1 h, washed with water, dried with anhydrous magnesium sulfate, and stripped down to a white solid. The crude solid was recrystallized from 2-propanol (2 mL) to furnish 3-[2-bromo-4-(1-methylethyl)phenyl]-5-methyl-N-propyl-3H-1,2,3-triazolo[4,5-d]pyrimidin-7-amine as a white needles (0.58 g; mp 156-157 °C). Part G: Rearrangement of Product F: The product of Part F (0.40 g) was dissolved in dry DMF (10 mL) and added NaH (0.103 g, 60% in oil) at room temperature under a nitrogen atmosphere. The mixture was stirred at room temperature for 14 h and partitioned between ethyl acetate (25 mL) and water (25 mL). The organic layer was washed with brine, dried, and stripped in vacuum to a solid. The solid was recrystallized from 2-propanol (0.5 mL) to afford the title compound as a white crystalline solid (0.35 g; mp 80-81 °C). Elemental analysis for C₁₇H₂₁BrN₆: Theory C: 52.45, H: 5.45, N: 21.59. Found: C: 52.19, H: 5.37, N: 21.48.

Example 2

N-[2-bromo-4-(1-methylethyl)phenyl]-N-ethyl-5-methyl-3-propyl-3H-1,2,3-triazolo[4,5-d]pyrimidin-7-amine

Part H: (S)-4-chloro-1-(1-methoxymethyl-3-methoxypropyl)-6-methyl-1H-1,2,3-triazolo[4,5-c]pyridine: 3-amino-2-chloro-6-methyl-4-N-(1-methoxymethyl-3-methoxypropyl)pyridin-4-amine (4.1 g, 14.98 mmol) was dissolved in a mixture of CH₂Cl₂ (40 mL) and 50% acetic acid (40 mL) and cooled to 0 °C in an ice bath. To that a solution of NaNO₂ (1.84 g, 26.86 mmol) in water (10 mL) was added dropwise and the reaction was stirred at 0 °C for 30 min and at 25 °C for 1.5 h. Then the acetic acid was neutralized with solid NaHCO₃ and water (80 mL) was added. The mixture was extracted with EtOAc (2x100 mL) and the combined organic extracts were combined and washed with brine (50 mL), dried and

stripped in vacuo. The residue was chromatographed on silica gel (40% EtOAc/hexanes eluent) to give the product (4.05 g, 56% overall for the eight steps). NMR(CDCl₃) δ 7.25 (s, 1H), 5.04-5.13 (m, 1H), 3.98 (dd, 1H, $J_1=9.9$ Hz, $J_2=8.4$ Hz), 3.84 (dd, 1H, $J_1=10.2$ Hz, $J_2=4.4$ Hz), 3.39 (dt, 1H, $J_1=9.9$ Hz, $J_2=4.8$ Hz), 3.25 (s, 3H), 3.17 (s, 3H), 2.91 (dt, 1H, $J_1=9.5$ Hz, $J_2=4.0$ Hz), 2.68 (s, 3H), 2.22-2.6 (m, 2H).

10 **Part I:** (S)-4-chloro-1-(1-methoxymethyl-3-methoxypropyl)-6-methyl-1H-1,2,3-triazolo[4,5-c]pyridine (2.0 g, 7 mmol) and 2-chloro-4,6-dimethylaniline (1.094 g, 7 mmol) were dissolved in dry THF and cooled to 0 °C in an ice bath. To that a 1 M solution sodium
15 hexamethyldisilazide (16 mL, 16 mmol) was added dropwise and the solution was stirred at 0 °C for 45 min. Then it was quenched with water (30 mL) and partitioned between EtOAc and water (20 mL). The organic extract was washed with brine (50 mL), dried (MgSO₄) and stripped in vacuo.
20 The residue was purified by silica gel chromatography (40% EtOAc/hexanes eluent) and crystallized from hexanes to give the product (2.42 g, 85%), mp 108-109 °C, $[\alpha]_{D25} -32.38$ (c=0.200 g/dL, CHCl₃) 99.6% ee by chiral HPLC. This was converted to the methylsulfonate salt, mp 98-
25 100 °C, after crystallization from ether/hexanes, $[\alpha]_{D25} -29.00$ (c=0.200 g/dL, CHCl₃).

30 **(R,S)-N-(2-chloro-4,6-dimethylphenyl)-6-methyl-1-(1-methoxymethyl-3-methoxypropyl)-1H-1,2,3-triazolo[4,5-c] pyridin-4-amine**

Part A: (R,S)-2-Aminobutyrolactone hydrobromide
35 (8.0 g, 44 mmol) and triphenylmethyl chloride (12.8 g, 46 mmol) were suspended in dry CH₃CN (80 mL) at 25 °C. To that Et₃N (13.6 mL, 100 mmol) was added dropwise, the

reaction mixture was stirred at 25 °C for 4 h and partitioned between EtOAc (120 mL) and water (50 mL). The organic layer was washed with water (50 mL), brine (50 mL), dried (MgSO₄) and stripped in vacuo. The residue was recrystallized from EtOAc/hexanes to give 2-triphenylmethylamino-butyrolactone (10.5 g).

Part B: Lithium aluminum hydride (1.4 g, 36 mmol) was suspended in dry THF (50 mL) and cooled to 0 °C in an ice bath. To that a solution of 2-triphenylmethylamino-butyrolactone (11 g, 31.9 mmol) in dry THF (70 mL) was added dropwise over a period of 20 min. After the addition was over the reaction mixture was stirred at 0 °C for 1 h, at 25 °C for 3h and quenched by the sequential addition of water (2 mL) 1 N NaOH (2 mL) and water (3 mL), and diluted with ether (150 mL). The precipitated solids were filtered off and the filtrate was concentrated in vacuo to give (R,S)-2-N-triphenylamino-1,4-butanediol. This was used in the same synthetic scheme as previously described for the chiral material (Example 414, Parts C-I) to obtain the racemic material.

The compounds listed in Table 8 were prepared by the methods exemplified in Examples 221-232, 259, 414 and 414A.

Example 526

This example illustrates an alternative method for making the compound of Example 32.

5

Part A. (±)-1-Methoxy-2-butanol

Methanesulfonate (1). A solution of 1-methoxy-2-butanol (52.08 g, 57.23 mL, 0.5 mol) and Et₃N (108.2 mL, 0.75 mol, 1.5 equiv) in CH₂Cl₂ (500 mL) was treated
10 dropwise with methanesulfonyl chloride (68.73 g, 46.44 mL, 0.6 mol, 1.2 equiv) at 0 °C under N₂. The reaction mixture was warmed to 25 °C and stirred at 25 °C for an additional 4 h before being quenched with H₂O (300 mL). The two layers were separated, and the aqueous was
15 extracted with CH₂Cl₂ (3 x 100 mL). The combined CH₂Cl₂ extracts were washed with H₂O (2 x 200 mL) and saturated aqueous NaCl (200 mL), dried (MgSO₄), and concentrated in vacuo. The residue was dried enough in vacuo to
20 afforded the desired mesylate 1 (85-90.0 g, 91 g theoretical, 93-98%) as a pale-yellow oil, which was pure enough and directly used in the next reaction without further purification.

The analytically pure sample of 1 was obtained by silicon-gel column chromatography purification and 1 was
25 obtained as a colorless oil.

Part B. (±)-1-Methoxy-2-butyl Azide (2). A solution of crude mesylate 1 (90.0 g, 0.495 mol) in DMF (500 mL) was treated with NaN₃ (48.22g, 0.74 mol, 1.5
30 equiv) at 25 °C under N₂. The resulting reaction mixture was warmed to 55-60 °C for 6-8 h with stirring before being quenched with H₂O (500 mL). The pale-yellow solution was then extracted with EtOAc or Et₂O (4 x 200 mL). The combined EtOAc (or Et₂O) extracts were
35 washed with H₂O (3 x 500 mL), dried (MgSO₄), and concentrated in vacuo. The residual solution was found to contain desired azide 2 (60.3 g, 64.5 g theoretical,

94%), which was found to be pure enough and directly used in the following reaction without further purification.

The analytically pure sample of 2 was obtained by
5 SiO₂ column chromatography purification as a colorless, low boiling-point liquid.

Part C. (±)-4-Amino-5-carbamoyl-1-(1-methoxy-2-)butyl-1H-1,2,3-triazole (3). A suspension of
10 cyanoacetamide (46.5 g, 0.553 mol, 1.2 equiv) in absolute EtOH (200 mL) was treated with EtONa (62.73 g, 0.922 mol, 2.0 equiv) at 25 °C under N₂, and the resulting mixture was warmed to reflux for 15 min under N₂. The cooled mixture was then treated with a solution
15 of 1-methoxy-2-butyl azide 2 (59.5 g, 0.467 mol) in Et₂O and the mixture was diluted with additional EtOH (260 mL) at 25 °C. The resulting reaction mixture was warmed to reflux and stirred for 6-8 h at reflux before being cooled to room temperature. The solvent was removed in
20 vacuo, and the residue was treated with H₂O (300 mL) and EtOAc (300 mL). The two layers were separated, and the aqueous was extracted with EtOAc (5 x 100 mL). The combined EtOAc extracts were washed with saturated aqueous NaCl (50 mL), dried in vacuo, and concentrated
25 in vacuo. The residual yellow solid was directly recrystallized from MeOH (100-150 mL) to afford the desired 1,2,3-triazole 3 (70.7 g, 98.2 g theoretical, 72%) as white crystals.

Part D. (±)-9-(1-Methoxy-2-)butyl-2-methyl-8-azaadenine (4). Method A: A solution of 3 (10.65 g, 0.05 mol) in absolute EtOH (50 mL) was treated with EtONa (6.8 g, 0.1 mol, 2.1 equiv) and EtOAc (8.8 g, 10.0 mL, 0.5 mol, 10 equiv) at 25 °C under N₂, and the
35 resulting reaction mixture was warmed to reflux with stirring for 6-8 h before being quenched with H₂O (50 mL). The solution was then concentrated in vacuo to

remove most of EtOH. The residue was treated with H₂O (50 mL), acidified with concentrated HCl (pH 6-7), and extracted with EtOAc (5 x 50 mL). The combined EtOAc extracts were washed with saturated aqueous NaCl (20 mL), dried (MgSO₄), and concentrated in vacuo. The residual pale-yellow solid was directly recrystallized from 80% EtOAc-Hexane or EtOH to afford 8-azaadenine 4 (8.4 g, 11.85 theoretical, 71%) as white crystals.

Method B: A suspension of cyanoacetamide (47.1 g, 0.561 mol, 1.2 equiv) in absolute EtOH (200 mL) was treated with EtONa (95.3 g, 1.4 mol, 3.0 equiv) at 25°C under N₂, and the resulting mixture was warmed to reflux for 15 min. under N₂. The cooled mixture was then treated with a solution of 1-methoxy-2-butyl azide 2 (60.3 g, 0.467 mol) in EtOAc (or Et₂O) in absolute EtOH (170 mL) at 25 °C, and the resulting reaction mixture was warmed to reflux and stirred 4-6 h at reflux before being cooled to RT. EtOAc (120 mL) was added to the reaction mixture, and the resulting mixture was warmed to reflux for an additional 6-10 h. The cooled reaction mixture was treated with H₂O (200 mL), and the solution was concentrated in vacuo to remove most of EtOH. The residue was treated with H₂O (100 mL) and acidified with concentrated HCl (pH 6-7), and extracted with EtOAc (6 x 150 mL). The combined EtOAc extracts were washed with saturated aqueous NaCl (100 mL), dried (MgSO₄), and concentrated in vacuo. The residual pale-yellow solid was recrystallized from 80% EtOAc-Hexane (or EtOH) to afford 8-azaadenine 4 (70.8 g, 110.7 g theoretical, 64% for two steps) as white crystals.

Part E. (±)-4-Chloro-1-(1-methoxy-2-)butyl-2-methyl-8-azaadenine (5). Method A: A solution of 4 (6.78 g, 0.017 mol) in POCl₃ (30 mL) was warmed to reflux for 3 h. The excess POCl₃ was removed in vacuo, and the residue was treated with H₂O (50 mL) and EtOAc (50 mL). The two layers were separated, and the aqueous

was extracted with EtOAc (3 x 50 mL). The combined EtOAc extracts were washed with H₂O (2 x 50 mL) and saturated aqueous NaCl (30 mL), dried (MgSO₄), and concentrated in vacuo. Flash chromatography (SiO₂, 10-20% EtOAc-Hexane gradient elution) afforded 5 (6.65 g, 7.30 g theoretical, 91%) as a colorless oil, which solidified upon standing in vacuo.

Method B: A solution of 4 (170 mg, 0.72 mmol) was treated with POCl₃ (2 mL) and *N,N*-diethylaniline (0.5 mL) at 25 °C under N₂, and the resulting mixture was warmed to reflux for 4-6 h. The excess POCl₃ was removed in vacuo, and the residue was directly purified by flash chromatography (SiO₂, 10-20% EtOAc-Hexane gradient elution) to afford 5 (159 mg, 184 mg theoretical, 86%) as a colorless oil, which solidified in vacuo. The product obtained by Method B was identical in all comparable respects with that obtained from Method A.

Part F. (±)-1-(1-Methoxy-2-)butyl-2-methyl-4-[(2,4,6-trimethyl)phenyl]amino-8-azaadenine (6).

A solution of 5 (7.0 g, 0.0274 mol) in toluene (50 mL) was treated with 2,4,6-trimethylphenyl amine (8.1 g, 0.06 mol, 2.2 equiv) at 25 °C under N₂. The resulting reaction mixture was warmed to reflux for 6-8 h under N₂. The white solid (2,4,6-trimethylaniline HCl salt) was filtered and the solid was washed with toluene (10-20 mL). The filtrate was concentrated in vacuo. The residual pale-yellow solid was recrystallized from 30% EtOAc-Hexane to afford the title compound 6 (7.9 g, 9.7 g theoretical, 81%) as white crystals.

Utility

CRF-R1 Receptor Binding Assay for the Evaluation of Biological Activity

5

The following is a description of the isolation of cell membranes containing cloned human CRF-R1 receptors for use in the standard binding assay as well as a description of the assay itself.

10 Messenger RNA was isolated from human hippocampus. The mRNA was reverse transcribed using oligo (dt) 12-18 and the coding region was amplified by PCR from start to stop codons. The resulting PCR fragment was cloned into the EcoRV site of pGEMV, from whence the insert was
15 reclaimed using XhoI + XbaI and cloned into the XhoI + XbaI sites of vector pm3ar (which contains a CMV promoter, the SV40 't' splice and early poly A signals, an Epstein-Barr viral origin of replication, and a hygromycin selectable marker). The resulting expression
20 vector, called phchCRFR was transfected in 293EBNA cells and cells retaining the episome were selected in the presence of 400 μ M hygromycin. Cells surviving 4 weeks of selection in hygromycin were pooled, adapted to
25 growth in suspension and used to generate membranes for the binding assay described below. Individual aliquots containing approximately 1×10^8 of the suspended cells were then centrifuged to form a pellet and frozen.

For the binding assay a frozen pellet described above containing 293EBNA cells transfected with hCRFR1
30 receptors is homogenized in 10 ml of ice cold tissue buffer (50 mM HEPES buffer pH 7.0, containing 10 mM $MgCl_2$, 2 mM EGTA, 1 μ g/ml aprotinin, 1 μ g/ml leupeptin and 1 μ g/ml pepstatin). The homogenate is centrifuged at 40,000 x g for 12 min and the resulting pellet
35 rehomogenized in 10 ml of tissue buffer. After another centrifugation at 40,000 x g for 12 min, the pellet is

resuspended to a protein concentration of 360 µg/ml to be used in the assay.

Binding assays are performed in 96 well plates; each well having a 300 µl capacity. To each well is
5 added 50 µl of test drug dilutions (final concentration of drugs range from 10^{-10} - 10^{-5} M), 100 µl of ^{125}I -ovine-CRF (^{125}I -o-CRF) (final concentration 150 pM) and 150 µl of the cell homogenate described above. Plates are then allowed to incubate at room temperature for 2
10 hours before filtering the incubate over GF/F filters (presoaked with 0.3% polyethyleneimine) using an appropriate cell harvester. Filters are rinsed 2 times with ice cold assay buffer before removing individual filters and assessing them for radioactivity on a gamma
15 counter.

Curves of the inhibition of ^{125}I -o-CRF binding to cell membranes at various dilutions of test drug are analyzed by the iterative curve fitting program LIGAND [P.J. Munson and D. Rodbard, *Anal. Biochem.* 107:220
20 (1980), which provides K_i values for inhibition which are then used to assess biological activity.

A compound is considered to be active if it has a K_i value of less than about 10000 nM for the inhibition of CRF.

Inhibition of CRF-Stimulated Adenylate Cyclase Activity

Inhibition of CRF-stimulated adenylate cyclase activity was performed as described by G. Battaglia
30 et al. *Synapse* 1:572 (1987). Briefly, assays were carried out at 37° C for 10 min in 200 µl of buffer containing 100 mM Tris-HCl (pH 7.4 at 37° C), 10 mM MgCl_2 , 0.4 mM EGTA, 0.1% BSA, 1 mM isobutylmethylxanthine (IBMX), 250 units/ml
35 phosphocreatine kinase, 5 mM creatine phosphate, 100 mM guanosine 5'-triphosphate, 100 nM oCRF, antagonist peptides (concentration range 10^{-9} to 10^{-6} M) and 0.8

mg original wet weight tissue (approximately 40-60 mg protein). Reactions were initiated by the addition of 1 mM ATP/³²P]ATP (approximately 2-4 mCi/tube) and terminated by the addition of 100 µl of 50 mM Tris-HCL, 45 mM ATP and 2% sodium dodecyl sulfate. In order to monitor the recovery of cAMP, 1 µl of [³H]cAMP (approximately 40,000 dpm) was added to each tube prior to separation. The separation of [³²P]cAMP from [³²P]ATP was performed by sequential elution over Dowex and alumina columns. Recovery was consistently greater than 80%.

Some compounds of this invention were tested in this assay and found to be active.

15 In vivo Biological Assay

The *in vivo* activity of the compounds of the present invention can be assessed using any one of the biological assays available and accepted within the art. Illustrative of these tests include the Acoustic Startle Assay, the Stair Climbing Test, and the Chronic Administration Assay. These and other models useful for the testing of compounds of the present invention have been outlined in C.W. Berridge and A.J. Dunn *Brain Research Reviews* 15:71 (1990)

Compounds may be tested in any species of rodent or small mammal. Disclosure of the assays herein is not intended to limit the enablement of the invention.

Compounds of this invention have utility in the treatment of imbalances associated with abnormal levels of corticotropin releasing factor in patients suffering from depression, affective disorders, and/or anxiety.

Compounds of this invention can be administered to treat these abnormalities by means that produce contact of the active agent with the agent's site of action in the body of a mammal. The compounds can be

administered by any conventional means available for use in conjunction with pharmaceuticals either as individual therapeutic agent or in combination of therapeutic agents. They can be administered alone,
5 but will generally be administered with a pharmaceutical carrier selected on the basis of the chosen route of administration and standard pharmaceutical practice.

The dosage administered will vary depending on
10 the use and known factors such as pharmacodynamic character of the particular agent, and its mode and route of administration; the recipient's age, weight, and health; nature and extent of symptoms; kind of concurrent treatment; frequency of treatment; and
15 desired effect. For use in the treatment of said diseases or conditions, the compounds of this invention can be orally administered daily at a dosage of the active ingredient of 0.002 to 200 mg/kg of body weight. Ordinarily, a dose of 0.01 to 10
20 mg/kg in divided doses one to four times a day, or in sustained release formulation will be effective in obtaining the desired pharmacological effect.

Dosage forms (compositions) suitable for administration contain from about 1 mg to about 100
25 mg of active ingredient per unit. In these pharmaceutical compositions, the active ingredient will ordinarily be present in an amount of about 0.5 to 95% by weight based on the total weight of the composition.

30 The active ingredient can be administered orally in solid dosage forms, such as capsules, tablets and powders; or in liquid forms such as elixirs, syrups, and/or suspensions. The compounds of this invention can also be administered parenterally in sterile
35 liquid dose formulations.

Gelatin capsules can be used to contain the active ingredient and a suitable carrier such as but

not limited to lactose, starch, magnesium stearate, steric acid, or cellulose derivatives. Similar diluents can be used to make compressed tablets. Both tablets and capsules can be manufactured as sustained
5 release products to provide for continuous release of medication over a period of time. Compressed tablets can be sugar-coated or film-coated to mask any unpleasant taste, or used to protect the active
10 ingredients from the atmosphere, or to allow selective disintegration of the tablet in the gastrointestinal tract.

Liquid dose forms for oral administration can contain coloring or flavoring agents to increase patient acceptance.

15 In general, water, pharmaceutically acceptable oils, saline, aqueous dextrose (glucose), and related sugar solutions and glycols, such as propylene glycol or polyethylene glycol, are suitable carriers for parenteral solutions. Solutions for parenteral
20 administration preferably contain a water soluble salt of the active ingredient, suitable stabilizing agents, and if necessary, buffer substances. Antioxidizing agents, such as sodium bisulfite, sodium sulfite, or ascorbic acid, either alone or in
25 combination, are suitable stabilizing agents. Also used are citric acid and its salts, and EDTA. In addition, parenteral solutions can contain preservatives such as benzalkonium chloride, methyl- or propyl-paraben, and chlorobutanol.

30 Suitable pharmaceutical carriers are described in "Remington's Pharmaceutical Sciences", A. Osol, a standard reference in the field.

Useful pharmaceutical dosage-forms for administration of the compounds of this invention can
35 be illustrated as follows:

Capsules

A large number of units capsules are prepared by filling standard two-piece hard gelatin capsules each with 100 mg of powdered active ingredient, 150 mg lactose, 50 mg cellulose, and 6 mg magnesium stearate.

Soft Gelatin Capsules

10 A mixture of active ingredient in a digestible oil such as soybean, cottonseed oil, or olive oil is prepared and injected by means of a positive displacement was pumped into gelatin to form soft gelatin capsules containing 100 mg of the active
15 ingredient. The capsules were washed and dried.

Tablets

A large number of tablets are prepared by conventional procedures so that the dosage unit was
20 100 mg active ingredient, 0.2 mg of colloidal silicon dioxide, 5 mg of magnesium stearate, 275 mg of microcrystalline cellulose, 11 mg of starch, and 98.8 mg lactose. Appropriate coatings may be applied to increase palatability or delayed adsorption.

25

The compounds of this invention may also be used as reagents or standards in the biochemical study of neurological function, dysfunction, and disease.

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

Please See Extra Sheet.

1. ☒ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.

13.1, 13.2 and 13.3) for the reasons indicated below:

The inventions listed as Groups 1-13 do not relate to a single inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons:

Compounds and the process of making and methods of use that are of the same scope are considered to form a single inventive concept as required by PCT Rule 13.1, 37 CFR 1.475(d). The groups outlined above are not so linked as to form a single inventive concept as they are either drawn to dissimilar compounds of varying cores and functional moieties which are not art recognized equivalents. The second methods of use are grouped separately pursuant to 37 CFR 1.475 (d).
